(54) Title: NOVEL ORGANIC ANION TRANSPORT PROTEINS

(57) Abstract: The current invention discloses nucleic acid and amino acid sequences for novel organic anion transfer proteins ("OATPs"). The invention encompasses the OATPs described herein, together with vectors containing the cDNA sequences, host cells containing the vectors and polypeptides having all or part of an OATP. Also encompassed are uses for OATPs for targeting drugs to specific organs and for modulating the concentration of endogenous substrates.

## NOVEL ORGANIC ANION TRANSPORT PROTEINS

This application claims priority from provisional U.S. Application Serial No. 60/135,081, filed May 20, 1999, which is incorporated herein by reference in its entirety.

### Field of the Invention

The invention claims isolated nucleic acid encoding all or a portion of novel members of the organic anion transport protein ("OATP") designated OATP2, OATP-RP1, OATP-RP2, OATP-RP3, OATP-RP4 and OATP-RP5. Also claimed are vectors containing the nucleic acid sequences, host cells containing the vectors and polypeptides having all or part of the amino acid sequence of OATP2, OATP-RP1, OATP-RP2, OATP-RP3, OATP-RP4 and OATP-RP5. Tissue expression of the transporter is described as well as some of its substrates. Also claimed are uses for these novel OATPs, including for targeting drugs to specific tissues, for modulating the concentration of endogenous substrates, and for identifying a substrate capable of being transported by a novel OATP of the invention.

### Background of the Invention

The liver functions in the clearance of a large variety of metabolic products, drugs and other xenobiotics by transporting them across the sinusoidal membrane into the hepatocyte. Several classes of transport systems have been described that mediate these processes including the Na<sup>+</sup>/taurocholate cotransporter polypeptide, NTCP, in rat and human liver (Hagenbuch, B., et al. (1991) *Proc. Natl. Acad. Sci. USA* 88:10629-33; Hagenbuch, B. et al., (1994) *J. Clin. Invest.* 93:1326-31) and a family of organic anion transporting polypeptides (OATPs) that are principally expressed in liver, kidney and brain, and transport a broad spectrum of substrates in a sodium-independent manner (Meier, P.J., et al., (1997) *Hepatology* 26:1667-77; Wolkoff, A.W., (1996) *Semin. Liver Dis.* 16:121-127). The distribution of this latter family of

transporters in liver, kidney and choroid plexus in the brain is thought to reflect common physiological requirements of these organs for the clearance of a multitude of organic anions. There are three OATP isoforms in the rat: roatp1 (Jacquemin, E., et al., (1994) *Proc. Natl. Acad. Sci. USA* 91:133-37); roatp2 (Noe, B.A., et al., (1997) *Proc. Natl. Acad. Sci. USA* 94:10346-50; and roatp3 (Abe, T., et al., (1998) *J. Biol. Chem.* 273:11395-401). In addition to bile acids, OATPs are known to transport a variety of other compounds. These include, depending on the transporter, unconjugated and conjugated steroids such as estrone sulfate, estradiol-17 $\beta$ -glucuronide, aldosterone, and cardiac glycosides (Boussuyt, X., et al., (1996) *J. Pharmacol. Exp. Ther.* 276:891-6; Boussuyt, X. (1996) *J. Hepatol.* 25:733-8; Kanai, N., et al., (1996) *Am. J. Physiol.* 270:F319-F325; Kanai, N., et al., (1996) *Am. J. Physiol.* 270:F326-F331; Noe, B.A., et al., (1997) *Proc. Natl. Acad. Sci. USA* 94:10346-50). Bromosulfophthalien (Jacquemin, E., et al., (1994) *Proc. Natl. Acad. Sci. USA* 91:133-7); mycotoxin (Kontaxi, M., et al., (1996) *J. Pharmacol. Exp. Ther.* 279:1507-13); leukotriene C<sub>4</sub> (Li, L., et al., (1998) *J. Biol. Chem.* 273:16184-91); and thyroid hormone (Abe, T., et al., (1998) *J. Biol. Chem.* 273:11395) are additional substrates.

Several proteins have been identified. Jacquemin, E., et al., (1994) *Proc. Natl. Acad. Sci. U.S.A.*, 91:133-137 reported the first cloning and identification of a member of the OATP transporter family, namely the rat oatp1. The first cloning and identification of a human OATP was reported in Kullak-Ublick, G.A., et al., (1995) *Gastroenterology*, 109:1274-1282. Its expression was found in liver, kidney brain and other organs. The authors concluded, based on substrate specificities, that it was not the human orthologue of rat oatp1.

Substrate specificities of rat oatp1 are discussed in Kullak-Ublick, G.A. et al., (1994) *Hepatology*, 20:411-416, while substrate specificities of human OATP are discussed in Boussuyt, X., et al., (1996) *J. Hepatol.*, 25:733-738.

Data was later discovered showing that rat oatp1 is involved in the transport of steroids (Boussuyt, X., et al., (1996) *J. Pharmacol. Exp. Ther.*, 276:891-896), and that human OATP acts as a transporter for the psychoactive hormone DHEAS (Kullak-Ublick, G.A., et al., (1998) *FEBS Lett.*, 424:173-176). For a review of the OATP

family and organic anion transport in the liver, see Wolkoff, A.W., (1996) *Semin. Liver Dis.*, 16:121-127.

A third rat OATP isoform that was shown to transport thyroid hormones T3 and T4 was cloned and reported in Abe, T., et al., (1998) *J. Biol. Chem.*, 273:22395-22401.

All references cited herein, whether *supra* or *infra*, are hereby incorporated by reference in their entirety.

#### Summary of the Invention

The present invention encompasses novel organic anion transport proteins ("OATP") and polynucleotides encoding said OATPs. The OATPs disclosed herein are designated OATP2, OATP-RP2, OATP-RP3, OATP-RP4, OATP-RP5 and OATP-RP1. A polynucleotide sequence of each OATP is disclosed herein, along with the deduced amino acid sequence. The cDNAs encoding the OATPs of the present invention have been deposited with the American Type Culture Collection and given Accession Numbers ATCC 207213 (OATP2), ATCC 207212 (OATP-RP2), ATCC 207209 (OATP-RP3), ATCC 207210 (OATP-RP4), ATCC 207211 (OATP-RP5), and ATCC 207214 (OATP-RP1).

The present inventors sequenced the cDNAs encoding the novel OATPs and determined the primary sequence of the deduced proteins. Disclosed herein are the nucleic acid sequence (SEQ ID NO:1) and amino acid sequence (SEQ ID NO:2) of OATP2; the nucleic acid sequence (SEQ ID NO:3) and amino acid sequence (SEQ ID NO:4) of OATP-RP2; the nucleic acid sequence (SEQ ID NO:5) and amino acid sequence (SEQ ID NO:6) of OATP-RP3; the nucleic acid sequence (SEQ ID NO:7) and amino acid sequence (SEQ ID NO:8) of OATP-RP4; the nucleic acid sequence (SEQ ID NO:9) and amino acid sequence (SEQ ID NO:10) of OATP-RP5; and the nucleic acid sequence (SEQ ID NO:11) and amino acid sequence (SEQ ID NO:12) of OATP-RP1.

The OATPs of the present invention can be produced by: (1) inserting the cDNA of a disclosed OATP into an appropriate expression vector; (2) transfecting the expression vector into an appropriate transfection host(s); (3) growing the transfected

host(s) in appropriate culture media; and (4) assaying the transport activity in the transfected cells.

The present invention therefore provides a purified and isolated nucleic acid molecule, preferably a DNA molecule, having a sequence which codes for an OATP, or an oligonucleotide fragment of the nucleic acid molecule which is unique to an OATP of the invention. In a preferred embodiment of the invention, the purified and isolated nucleic acid molecule has the sequence as shown in SEQ ID NO:1 (OATP2). In another preferred embodiment, the purified and isolated nucleic acid molecule has the sequence as shown in SEQ ID NO:3 (OATP-RP2). In still another preferred embodiment the purified and isolated nucleic acid molecule has the sequence as shown in SEQ ID NO:5 (OATP-RP3). In still another preferred embodiment of the present invention the purified and isolated nucleic acid molecule has the nucleotide sequence as shown in SEQ ID NO:7 (OATP-RP4). In still another preferred embodiment the purified and isolated nucleic acid molecule has the sequence as shown in SEQ ID NO:9 (OATP-RP5). In still another preferred embodiment of the present invention the purified and isolated nucleic acid molecule has the nucleotide sequence as shown in SEQ ID NO:11 (OATP-RP1).

The invention also contemplates a double stranded nucleic acid molecule comprising a nucleic acid molecule of the invention or an oligonucleotide fragment thereof hydrogen bonded to a complementary nucleotide base sequence.

The terms "isolated and purified nucleic acid", "isolated and purified polynucleotide", "substantially pure nucleic acid", and "substantially pure polynucleotide", e.g., substantially pure DNA, refer to a nucleic acid molecule which is one or both of the following: (1) not immediately contiguous with either one or both of the sequences, e.g., coding sequences, with which it is immediately contiguous (i.e., one at the 5' end and one at the 3' end) in the naturally occurring genome of the organism from which the nucleic acid is derived; or (2) which is substantially free of a nucleic acid sequence with which it occurs in the organism from which the nucleic acid is derived. The term includes, for example, a recombinant DNA which is incorporated into a vector, e.g., into an autonomously replicating plasmid or virus, or into the genomic DNA of a prokaryote or eukaryote, or which exists as a separate molecule (e.g., a cDNA or a genomic DNA fragment

produced by PCR or restriction endonuclease treatment) independent of other DNA sequences. Substantially pure or isolated and purified DNA also includes a recombinant DNA which is part of a hybrid gene encoding additional OATP sequence.

5       The present invention provides in one embodiment: (a) an isolated and purified nucleic acid molecule comprising a sequence encoding all or a portion of a protein having the amino acid sequence as shown in SEQ ID NO:2 (OATP2); (b) nucleic acid sequences complementary to (a); (c) nucleic acid sequences which exhibit at least 80%, more preferably at least 90%, more preferably at least 95%, and  
10   most preferably at least 98% sequence identity to (a); or (d) a fragment of (a) or (b) that is at least 18 bases and which will hybridize to (a) or (b) under stringent conditions.

      The degree of homology (percent sequence identity) between two sequences may be determined, for example, by comparing the two sequences using computer  
15   programs commonly employed for this purpose. One suitable program is the GAP computer program described by Devereux et al., (1984) *Nucl. Acids Res.* 12:387. The GAP program utilizes the alignment method of Needleman and Wunsch (1970) *J. Mol. Biol.* 48:433, as revised by Smith and Waterman (1981) *Adv. Appl. Math.* 2:482. Briefly, the GAP program defines percent identity as the number of aligned symbols  
20   (i.e., nucleotides or amino acids) which are identical, divided by the total number of symbols in the shorter of the two sequences.

      As used herein the term "stringent conditions" encompasses conditions known in the art under which a nucleotide sequence will hybridize to: (a) an isolated and purified nucleic acid molecule comprising a sequence encoding a protein having the  
25   amino acid sequence as shown herein, or to (b) a nucleic acid sequence complementary to (a). Screening polynucleotides under stringent conditions may be carried out according to the method described in *Nature*, 313:402-404 (1985). Polynucleotide sequences capable of hybridizing under stringent conditions with the polynucleotides of the present invention may be, for example, allelic variants of the  
30   disclosed DNA sequences, or may be derived from other sources. General techniques of nucleic acid hybridization are disclosed by Sambrook et al., "Molecular Cloning: A Laboratory Manual", 2nd Ed., Cold Spring Harbor Laboratory, Cold Spring Harbor,

New York (1984); and by Haymes et al., "Nucleic Acid Hybridization: A Practical Approach", IRL Press, Washington, D.C. (1985), which references are incorporated herein by reference.

The present invention provides in another embodiment: (a) an isolated and  
5 purified nucleic acid molecule comprising a sequence encoding all or a portion of a  
protein having the amino acid sequence as shown in SEQ ID NO:4 (OATP-RP2); (b)  
nucleic acid sequences complementary to (a); (c) nucleic acid sequences which are at  
least 80%, more preferably at least 90%, more preferably at least 95%, and most  
preferably at least 98% sequence identity to (a); or (d) a fragment of (a) or (b) that is  
10 at least 18 bases and which will hybridize to (a) or (b) under stringent conditions.

The present invention provides in another embodiment: (a) an isolated and  
purified nucleic acid molecule comprising a sequence encoding all or a portion of a  
protein having the amino acid sequence as shown in SEQ ID NO:6 (OATP-RP3); (b)  
nucleic acid sequences complementary to (a); (c) nucleic acid sequences which are at  
15 least 80%, more preferably at least 90%, more preferably at least 95%, and most  
preferably at least 98% sequence identity to (a); or (d) a fragment of (a) or (b) that is  
at least 18 bases and which will hybridize to (a) or (b) under stringent conditions.

The present invention provides in another embodiment: (a) an isolated and  
purified nucleic acid molecule comprising a sequence encoding all or a portion of a  
20 protein having the amino acid sequence as shown in SEQ ID NO:8 (OATP-RP4); (b)  
nucleic acid sequences complementary to (a); (c) nucleic acid sequences which are at  
least 80%, more preferably at least 90%, more preferably at least 95%, and most  
preferably at least 98% sequence identity to (a); or (d) a fragment of (a) or (b) that is  
at least 18 bases and which will hybridize to (a) or (b) under stringent conditions.

25 The present invention provides in another embodiment: (a) an isolated and  
purified nucleic acid molecule comprising a sequence encoding all or a portion of a  
protein having the amino acid sequence as shown in SEQ ID NO:10 (OATP-RP5); (b)  
nucleic acid sequences complementary to (a); (c) nucleic acid sequences which are at  
least 80%, more preferably at least 90%, more preferably at least 95%, and most  
30 preferably at least 98% sequence identity to (a); or (d) a fragment of (a) or (b) that is  
at least 18 bases and which will hybridize to (a) or (b) under stringent conditions.

The present invention provides in another embodiment: (a) an isolated and purified nucleic acid molecule comprising a sequence encoding all or a portion of a protein having the amino acid sequence as shown in SEQ ID NO:12 (OATP-RP1); (b) nucleic acid sequences complementary to (a); (c) nucleic acid sequences which are at least 80%, more preferably at least 90%, more preferably at least 95%, and most preferably at least 98% sequence identity to (a); or (d) a fragment of (a) or (b) that is at least 18 bases and which will hybridize to (a) or (b) under stringent conditions.

The present invention also provides: (a) a purified and isolated nucleic acid molecule comprising a sequence as shown in SEQ ID NO:1 (OATP2); (b) nucleic acid sequences complementary to (a); (c) nucleic acid sequences having at least 80%, more preferably at least 90%, more preferably at least 95%, and most preferably at least 98% sequence identity to (a); or (d) a fragment of (a) or (b) that is at least 18 bases and which will hybridize to (a) or (b) under stringent conditions.

The present invention further provides: (a) a purified and isolated nucleic acid molecule comprising a sequence as shown in SEQ ID NO:3 (OATP-RP2); (b) nucleic acid sequences complementary to (a); (c) nucleic acid sequences having at least 80%, more preferably at least 90%, more preferably at least 95%, and most preferably at least 98% sequence identity to (a); or (d) a fragment of (a) or (b) that is at least 18 bases and which will hybridize to (a) or (b) under stringent conditions.

The present invention further provides: (a) a purified and isolated nucleic acid molecule comprising a sequence as shown in SEQ ID NO:5 (OATP-RP3); (b) nucleic acid sequences complementary to (a); (c) nucleic acid sequences having at least 80%, more preferably at least 90%, more preferably at least 95%, and most preferably at least 98% sequence identity to (a); or (d) a fragment of (a) or (b) that is at least 18 bases and which will hybridize to (a) or (b) under stringent conditions.

The present invention further provides: (a) a purified and isolated nucleic acid molecule comprising a sequence as shown in SEQ ID NO:7 (OATP-RP4); (b) nucleic acid sequences complementary to (a); (c) nucleic acid sequences having at least 80%, more preferably at least 90%, more preferably at least 95%, and most preferably at least 98% sequence identity to (a); or (d) a fragment of (a) or (b) that is at least 18 bases and which will hybridize to (a) or (b) under stringent conditions.

The present invention further provides: (a) a purified and isolated nucleic acid molecule comprising a sequence as shown in SEQ ID NO:9 (OATP-RP5); (b) nucleic acid sequences complementary to (a); (c) nucleic acid sequences having at least 80%, more preferably at least 90%, more preferably at least 95%, and most preferably at least 98% sequence identity to (a); or (d) a fragment of (a) or (b) that is at least 18 bases and which will hybridize to (a) or (b) under stringent conditions.

The present invention further provides: (a) a purified and isolated nucleic acid molecule comprising a sequence as shown in SEQ ID NO:11 (OATP-RP1); (b) nucleic acid sequences complementary to (a); (c) nucleic acid sequences having at least 80%, more preferably at least 90%, more preferably at least 95%, and most preferably at least 98% sequence identity to (a); or (d) a fragment of (a) or (b) that is at least 18 bases and which will hybridize to (a) or (b) under stringent conditions.

The present invention additionally covers polynucleotides and amino acid sequences of the present invention having one or more structural mutations including replacement, deletion or insertion mutations. For example, a signal peptide may be deleted, or conservative amino acid substitutions may be made to generate a protein that is still biologically competent or active.

The invention further contemplates a recombinant molecule comprising a nucleic acid molecule of the present invention or an oligonucleotide fragment thereof and an expression control sequence operatively linked to the nucleic acid molecule or oligonucleotide fragment. A transformant host cell including a recombinant molecule of the invention is also provided.

In another aspect, the invention features a cell or purified preparation of cells which include a novel gene encoding an OATP of the present invention, or which otherwise misexpresses a gene encoding an OATP of the present invention. The cell preparation can consist of human or non-human cells, e.g., rodent cells, e.g., mouse or rat cells, rabbit cells, non-human primate cells, or pig cells. In preferred embodiments, the cell or cells include an OATP transgene, e.g., a heterologous form of an OATP gene, e.g., a gene derived from humans (in the case of a non-human cell). The OATP transgene can be misexpressed, e.g., overexpressed or underexpressed. In other preferred embodiments, the cell or cells include a gene which misexpresses an endogenous OATP gene, e.g., a gene that expression of which is disrupted, e.g., a

knockout. Such cells can serve as a model for studying disorders which are related to mutated or misexpressed OATP alleles for use in drug screening.

Still further, the invention provides plasmids which comprise the nucleic acid molecules of the invention. Also encompassed within the invention are vectors  
5 comprising the nucleic acid sequences disclosed herein, as well as host cells comprising said vectors.

The present invention also includes a novel OATP of the present invention, or an active part thereof. A biologically competent or active form of the protein or part thereof is also referred to herein as an "active OATP or part thereof".

10 The invention further contemplates antibodies having specificity against an epitope of an OATP of the present invention or part of the protein. These antibodies may be polyclonal or monoclonal. The antibodies may be labeled with a detectable substance and they may be used, for example, to detect a novel OATP of the invention in tissue and cells. Additionally, the antibodies of the present invention, or  
15 portions thereof, may be used to make targeted antibodies that destroy OATP expressing cells (e.g., antibody-toxin fusion proteins, or radiolabelled antibodies).

The invention also permits the construction of nucleotide probes which encode part or all of a novel OATP protein of the invention or a part of the protein. Thus, the invention also relates to a probe comprising a nucleotide sequence coding for a  
20 protein, which displays the properties of a novel OATP of the invention or a peptide unique to the protein. The probe may be labeled, for example, with a detectable (e.g., radioactive) substance and it may be used to select from a mixture of nucleotide sequences a nucleotide sequence coding for a protein which displays the properties of a novel OATP of the invention.

25 The present invention also provides a transgenic non-human animal (e.g., a rodent, e.g., a mouse or a rat, a rabbit or a pig) or embryo all of whose germ cells and somatic cells contain a recombinant molecule of the invention, preferably a recombinant molecule comprising a nucleic acid molecule of the present invention encoding an OATP of the invention or part thereof. The recombinant molecule may  
30 comprise a nucleic acid sequence encoding an OATP of the present invention with a structural mutation, or may comprise a nucleic acid sequence encoding an OATP of the invention or part thereof and one or more regulatory elements which differ from

the regulatory elements that drive expression of the native protein. In another preferred embodiment, the animal has an OATP gene which is misexpressed or not expressed, e.g., a knockout. Such transgenic animals can serve as a model for studying disorders that are related to mutated or misexpressed OATPs of the present invention.

The invention still further provides a method for identifying a substance which is capable of binding a novel OATP of the invention, comprising reacting a novel OATP of the invention or part of the protein under conditions which permit the formation of a complex between the substance and a novel OATP protein or part of the protein, and assaying for substance-OATP complexes, for free substance, for non-complexed OATP, or for activation of an OATP.

An embodiment of the invention provides a method for identifying substrates which are capable of binding to a novel OATP protein of the invention, isoforms thereof, or part of the protein, said method comprising reacting a novel OATP protein of the invention, isoforms thereof, or part of the protein, with at least one substrate which potentially is capable of binding to the protein, isoform, or part of the protein, under conditions which permit the formation of substrate-transporter protein complexes, and assaying for substrate-transporter protein complexes, for free substrate, for non-complexed OATP protein, or for activation of an OATP. In a preferred embodiment of the method, substrates are identified which are capable of binding to and being transported by a novel OATP protein of the invention, isoforms thereof, or part of the protein.

The invention also provides methods for screening potentially useful pharmacological agonists or antagonists of the OATPs of the present invention. The method comprises testing potential agents by adding the agent to be tested to a cell expressing a novel OATP of the present invention in the presence of a compound known to be transported by an OATP of the invention, and measuring the augmentation or inhibition of transport of the known compound.

An OATP of the present invention is also useful to identify compounds that may be transported into an organ, e.g., the liver. Compounds that are found to be actively transported into the liver are useful as carriers for other therapeutics targeting the liver.

Also included within the scope of the present invention is a composition which includes an OATP of the present invention, a fragment thereof (or a nucleic acid encoding said OATP or fragment thereof) and one or more additional components, e.g., a carrier, diluent or solvent. The additional component can be one that renders  
5 the composition useful for in vitro, in vivo, pharmaceutical or veterinary use.

Encompassed within the present invention are agonists and antagonists of an OATP of the present invention. Pharmacological agonists or antagonists are useful to increase or decrease the flow of compounds transported by an OATP of the present invention. Said agonists and/or antagonists of the present invention are preferably  
10 administered with an acceptable carrier, diluent or solvent.

In another aspect, the present invention relates to a method of treating a mammal, e.g., a human, at risk for a disorder, e.g., a disorder characterized by aberrant or unwanted level or biological activity of an OATP of the present invention. Additionally, encompassed within the invention is a method of treating a mammal,  
15 e.g., a human, at risk for disorders of the liver. Since OATP2 is expressed exclusively in the liver, compounds that are optimized for OATP2 are useful to target hepatic delivery. These compounds in themselves may be useful therapeutics, or may be useful to chaperone other therapeutic compounds to the liver. In addition, blocking OATP2-compound interactions could provide benefit by decreasing its first-pass  
20 extraction by the liver and, thus, increasing plasma concentrations and prolonging the systemic half-life of a drug.

Also within the scope of the present invention are fusion proteins comprising all or a portion of an OATP of the present invention.

25 The primary object of the present invention is the identification of new human OATPs, as identified by the nucleic acid and amino acid sequences disclosed herein. Additional objects of the invention are the methods of using the cDNA, the OATP proteins, monoclonal antibodies specific for the novel OATPs, fusion proteins comprising a portion of the OATP protein of the present invention, and agonists  
30 and/or antagonists of the novel OATPs as described above.

### Brief Description of the Figures

Figure 1 is a Northern blot showing the mRNA tissue distribution of OATP2, OATP-RP1, OATP-RP2, OATP-RP4, and OATP-RP5. The tissues corresponding to the abbreviations above the lanes are indicated below.

5        Figure 2 shows that OATP2 transports pravastatin, dehydroepiandrosterone sulfate (DHEAS), taurocholate and thyroid hormone (T). Figure 2A shows specific uptake of [<sup>3</sup>H]-pravastatin and [<sup>3</sup>H]-DHEAS. Figure 2B shows specific uptake of [<sup>3</sup>H]-taurocholate. Panel 2C shows specific uptake of [<sup>125</sup>I]-thyroid hormone (T<sub>4</sub>). The uptake of radiolabeled substrate for 5 minutes into cells transfected with  
10    pCEPOATP-RP1 or empty vector (MOCK) was determined in the absence (solid bars) and presence (open bars) of excess unlabeled substrate.

Figure 3 shows a sequence alignment of OATP family members. The protein sequences of human OATP2, OATP-RP1, OATP-RP2, OATP-RP3, OATP-RP4, and OATP-RP5 are aligned with the other known OATP family members. Also shown is  
15    a consensus sequence in bold. A consensus is indicated if at least 6 out of the 12 sequences are identical at a given position. A residue is capitalized if it agrees with the consensus.

### Detailed Description of the Invention

20        The following definitions apply to the terms used throughout this specification, unless otherwise defined in specific instances:

“cloning” - isolation of a particular gene from genetic material, for example a genome, genomic library, or cDNA library into a plasmid or other vector;

25        “coding region” – the region of a nucleic acid sequence that codes for an active protein;

“OATP” – organic anion transport protein;

“stringent conditions” (as used concerning nucleic acid hybridization)—  
Southern blotting washed in 0.1 X SSC and 0.1% SDS at a temperature of at least about 65° C. See Maniatis et al., Molecular Cloning: A Laboratory Manual, Cold  
30    Spring Harbor Laboratory, Cold Spring Harbor, NY (1982); one skilled in the relevant art would recognize that less stringent conditions (e.g., 1X or 2X SSC,

0.1%SDS) may be employed in using the novel sequences disclosed herein to identify nucleic acid sequences encoding novel OATPs.

"Northern blotting"—a method of identifying particular RNA fragments by hybridization with a complementary nucleic acid, typically a cDNA or an oligonucleotide;

"open reading frame" or "ORF"—a DNA sequence containing a series of nucleotide triplets coding for amino acids and lacking any termination codes;

"plasmid"—cytoplasmic, autonomously replicating DNA elements found in microorganisms;

"promoter"—a region on DNA at which RNA polymerase binds and initiates transcription; and

"Southern blotting"—a method of identifying particular DNA fragments by hybridization with a complementary nucleic acid, typically a cDNA or an oligonucleotide;

"transport" - the movement of a substance across a biological membrane as determined by measuring the redistribution of such a substance across the membrane upon exposure to a transporter.

For definitions of other terms in this specification, see F. Sherman *et al.*, Laboratory Course Manual for Methods in Yeast Genetics, Cold Spring Harbor Laboratory, Cold Spring Harbor, NY (1987) and Lewin, B., Genes IV, Oxford University Press, Oxford (1990). For the definitions of abbreviations, see Aldrichimica Acta, Vol. 17, No. 1 (1984).

#### Use and utility

The amino acid sequences of the novel organic anion transport proteins of the present invention are aligned with known transporters of this family in Figure 3. The degree of sequence homology between the sequences of the present invention and known organic anion transporters indicates that the proteins of the present invention are organic anion transporters.

It is believed by those skilled in the art that OATP proteins may be involved in the transport of compounds into the liver. Persons of ordinary skill in the art can use the OATP proteins of the present invention to assay for agents that may increase or

decrease the rate of transport of compounds into the liver, or for compounds that are transported by the OATPs of the present invention that are useful as carriers for other compounds that are desired to be carried to a specific organ (e.g., the liver).

Therefore, agents that increase or decrease the rate of substrate transport by the OATPs of the present invention, or agents identified as carriers, are useful in the treatment of liver disease.

Because some of the OATPs of the present invention are organ specific/selective (e.g., OATP2 - liver; OATP-RP4 - heart and skeletal muscle, and OATP-RP5 - brain and testis), compound specificity is built into any specific substrate of these OATPs and into molecular carriers transported by these OATPs. An agent transported by the above OATPs of the present invention would thus be delivered to the tissues in which they are expressed and not to tissues lacking the above OATPs, thereby achieving tissue specific targeting.

The OATP nucleic acids of the present invention, or antisense nucleic acids, may be useful therapeutic or diagnostic agents. For such gene therapy, the nucleic acids may be incorporated into vectors and/or formulated as described below and in further detail in the art.

The present invention also provides a basis for diagnostic genetic screens for predicting response to drugs. At least one of the transporters disclosed and claimed herein is a transporter of a known drug (i.e., OATP2 transports pravastatin into hepatocytes). Other transporters disclosed herein may similarly transport additional drugs into tissues. Persons skilled in the art can: (1) screen the transporter genes for allelic variants (genotypes) in the general population by various sequencing methods; and (2) determine the association of these transporter genotypes in patients with response to the transported drug in clinical trials. Particular allelic variants may be more or less effective in transporting a drug, which would be related to drug efficacy. Thus, genotyping of the claimed transporters could form the basis of a clinical diagnostic test to predict a patient's response to drug therapy.

Persons skilled in the art can use the polypeptides and nucleic acids of this invention to prepare vectors, cells or cell lines, and antibodies. All of these are useful in assays for identification of OATP positive and negative modulators (i.e., agonists and/or antagonists) and OATP carriers. The term "positive modulator" as used herein

refers to an agent or compound that increases the rate or amount of transport of a compound into an organ, e.g., the liver, or an agent or compound that decreases the rate or amount of transport of a compound into an organ. The term "negative modulator" refers to a compound that is joined to a second compound to prevent the second compounds transport into or out of cells. The term "carrier" as used herein refers to an agent or compound that is transported by an OATP of the present invention and that is capable of being joined to or associated with another compound to chaperone that other compound into an organ, e.g., the liver. A carrier includes an agent that is used to transport a compound into an organ that is otherwise not transported into said organ, and includes an agent that increases the transport of a compound into an organ that is capable of being transported by an OATP.

One can administer OATP modulators and carriers to various mammalian species, such as monkeys, dogs, cats, mice, rats, humans, etc. By known methods, persons skilled in the pharmaceutical art can incorporate OATP modulators and carriers in a conventional systemic dosage form, such as a tablet, capsule, elixir or injectable formulation. The above dosage forms will also include any necessary physiologically acceptable carrier material, excipient, lubricant, buffer, antibacterial, bulking agent (such as mannitol), anti-oxidants (ascorbic acid or sodium bisulfite) or the like.

Process of preparation

In general

This specification describes the cloning and functional expression of full-length human cDNA clones of OATPs, preferably the nucleic acid sequence of OATP2 (SEQ ID NO:1), the amino acid sequence of OATP2 (SEQ ID NO:2), the nucleic acid sequence of OATP-RP2 (SEQ ID NO:3), the amino acid sequence of OATP-RP2 (SEQ ID NO:4), the nucleic acid sequence of OATP-RP3 (SEQ ID NO:5), the amino acid sequence of OATP-RP3 (SEQ ID NO:6), the nucleic acid sequence of OATP-RP4 (SEQ ID NO:7), the amino acid sequence of OATP-RP4 (SEQ ID NO:8), the nucleic acid sequence of OATP-RP5 (SEQ ID NO:9), the amino acid sequence of OATP-RP5 (SEQ ID NO:10), the nucleic acid sequence of OATP-RP1 (SEQ ID NO:11), and the amino acid sequence of OATP-RP1 (SEQ ID NO:12).

DNA clones comprising nucleotide sequences encoding the OATPs described above were deposited with the American Type Culture Collection ("ATCC") (10801 University Blvd., Manassas, VA 20110-2209) on April 20, 1999, and given the following ATCC Accession Numbers: 207209 (OATP-RP3), 207210 (OATP-RP4), 207211 (OATP-RP5), 207212 (OATP-RP2), 207213 (OATP2), and 207214 (OATP-RP1). The deposit(s) referred to herein will be maintained under the terms of the Budapest Treaty on the International Recognition of the Deposit of Microorganisms for purposes of Patent Procedure. These deposits are provided merely as convenience to those of skill in the art and are not an admission that a deposit is required under 35 U.S.C. §112. The sequence of the polynucleotides contained in the deposited materials, as well as the amino acid sequence of the of the polypeptides encoded thereby, are incorporated herein by reference and are controlling in the event of any conflict with any description of sequences herein. A license may be required to make, use or sell the deposited materials, and no such license is hereby granted.

#### 15      Nucleic acids

With the disclosed OATP gene sequences in hand, one skilled in the art can obtain OATP nucleic acids of this invention by known methods. Such methods include: (1) Southern and Northern blotting; (2) Western immunoblotting; (3) chemical synthesis; (4) synthesis by polymerase chain reaction (PCR) from primers; 20 (5) expression cloning; and (6) subtractive cDNA cloning.

Preferred nucleic acid sequences of the present invention include the following (preferably the coding sequences as shown below):

Persons skilled in the art can also modify the nucleic acids coding for the

10 OATPs of the present invention to prepare useful mutations. For example, one may modify the sequence to provide additional restriction endonuclease recognition sites in the nucleic acid. Such mutations may be silent or may change the amino acid encoded by the mutated codon. One can prepare these modified nucleic acids, for example, by mutating the nucleic acid coding for an OATP of the present invention to

15 result in deletion, substitution, insertion, inversion or addition of one or more amino acids in the encoded polypeptide. For methods of site-directed mutagenesis, see Taylor, J. W. et al. (1985), Nucl. Acids Res. 13, 8749-64 and Kunkel, J. A. (1985), Proc. Natl. Acad. Sci. USA 82: 482-92. In addition, kits for site-directed mutagenesis are available from commercial vendors (e.g., BioRad Laboratories, Richmond, CA;

20 Amersham Corp., Arlington Heights, IL). For disruption, deletion and truncation methods, see Sayers, J. R. et al. (1988), Nucl. Acids Res. 16: 791-800.

This invention also comprises modified nucleic acids, including (1) alternative splice exon variants; (2) allelic variants; and (3) chimeric proteins in which the fusion construct comprises an OATP or fragment thereof. Such modified nucleic acids can

25 be obtained by persons of ordinary skill in the art when armed with the present disclosure.

#### Expression vectors

This invention further concerns expression vectors comprising a nucleotide sequence encoding an OATP of the present invention. Preferably, the expression

30 vectors comprise all or a portion of the nucleic acid sequence as shown in SEQ ID NO:1, SEQ ID NO:3, SEQ ID NO:5, SEQ ID NO:7, SEQ ID NO:9, or SEQ ID NO:11; preferred is a nucleotide sequence encoding an OATP as shown above (i.e., the coding region).

Expression vectors are usually plasmids, but the invention includes other

35 vector forms that serve equivalent functions and become known in the art

subsequently hereto. A person skilled in the art might also stably integrate a sequence encoding an OATP into the chromosome of an appropriate host cell.

Expression vectors typically contain regulatory elements capable of affecting expression of an OATP. These regulatory elements can be heterologous or native OATP elements. Typically, a vector contains an origin of replication, a promoter, and a transcription termination sequence. The vector may also include other regulatory sequences, including mRNA stability sequences, which provide for stability of the expression product; secretory leader sequences, which provide for secretion of the expression product; environmental feedback sequences, which allow expression of the structural gene to be modulated (e.g., by the presence or absence of nutrients or other inducers in the growth medium); marking sequences, which are capable of providing phenotypic selection in transformed host cells; restriction sites, which provide sites for cleavage by restriction endonucleases; and sequences which allow expression in various types of hosts, including prokaryotes, yeasts, fungi, plants and higher eukaryotes.

An expression vector of this invention is at least capable of directing the replication, and preferably the expression, of the nucleic acids and protein of this invention. Suitable origins of replication include, for example, the Col E1, the SV40 viral, Epstein Barr viral, and the M13 origins of replication. Suitable promoters include, for example, the cytomegalovirus promoter, the lacZ promoter, the gal10 promoter and the Autographa californica multiple nuclear polyhedrosis virus (AcMNPV) polyhedral promoter. Suitable termination sequences include, for example, the bovine growth hormone, SV40, lacZ and AcMNPV polyhedral polyadenylation signals. Examples of selectable markers include neomycin, ampicillin, and hygromycin resistance and the like.

Persons skilled in the art may insert DNA encoding An OATP of the present invention into several commercially available vectors. Examples include vectors compatible with mammalian cells, such as pcDNA3 or pCEP4; baculovirus vectors such as pBlueBac; prokaryotic vectors such as pcDNA2; and yeast vectors such as pYes2. For vector modification techniques, see Sambrook et al. (1989), Molecular Cloning: A Laboratory Manual, Second Edition, Cold Spring Harbor Laboratory, Cold Spring Harbor, NY.

Host cells

This invention additionally concerns host cells containing an expression vector that comprises a sequence encoding an OATP, preferably the OATP2, OATP-RP2, OATP-RP3, OATP-RP4, OATP-RP5 or OATP-RP1 of the present invention. The  
5 host cells preferably contain an expression vector which comprises all or part of the DNA sequence having the nucleotide sequence substantially as shown in SEQ ID NO:1, SEQ ID NO:3, SEQ ID NO:5, SEQ ID NO:7, SEQ ID NO:9, or SEQ ID NO:11, particularly the coding regions thereof. Suitable host cells include both  
10 prokaryotic cells (e.g., *E. coli* strains HB101, DH5a, XL1 Blue, Y1090 and JM101) and eukaryotic cells (e.g., *Spodoptera frugiperda* insect cells, CHO cells, COS-7 cells, HEK 293 cells, human skin fibroblasts, and *S. cerevisiae* cells).

Persons skilled in the art may introduce expression vectors into host cells by various methods known in the art. Exemplary methods are transfection by calcium phosphate precipitation, electroporation, liposomal fusion, nuclear injection, and viral  
15 or phage infection. One may then culture the host cell under conditions permitting expression of large amounts of OATP.

One may identify such modified host cells by any of five general approaches:

(a) DNA-DNA hybridization with probes complementary to the sequence encoding an OATP (Southern blotting).

20 (b) detection of marker gene functions, such as thymidine kinase activity, resistance to antibiotics, and the like. A marker gene can be placed in the same plasmid as an OATP sequence under the regulation of the same or a different promoter.

(c) detection of mRNA transcripts by hybridization assays (e.g., Northern blotting or a nuclease protection assay using a probe complementary to the RNA  
25 sequence).

(d) immunodetection of gene expression (e.g., by Western blotting with antibody to OATP).

(e) PCR with primers homologous to expression vector sequences or  
30 sequences encoding OATP. The PCR produces a DNA fragment of predicted length, indicating incorporation of the expression system in the host cell.

Persons skilled in the art may determine DNA sequences by various known methods. See, for example, the dideoxy chain termination method in Sanger et al. (1977), Proc. Natl. Acad. Sci. USA 74: 5463-7 and the Maxam-Gilbert method in Maxam-Gilbert (1977), Proc. Natl. Acad. Sci. USA 74: 560-4.

5 One may use the host cells of this invention in a variety of ways that are now apparent. One may use the cells to screen for compounds that bind to or otherwise modulate or regulate the function of an OATP of the present invention, which would be useful for modulation, for example activation or inactivation, of OATP2, OATP-RP2, OATP-RP3, OATP-RP4, OATP-RP5 or OATP-RP1 activity; to study signal  
10 transduction mechanisms and protein-protein interactions; and to prepare OATP for the uses described below.

Not all expression vectors and DNA regulatory sequences will function equally well to express the DNA sequences of this invention. Neither will all host cells function equally well with the same expression system. However, one of  
15 ordinary skill in the art may make a selection among expression vectors, DNA regulatory sequences, and host cells using the guidance provided herein without undue experimentation and without departing from the scope of the invention.

#### Polypeptides

This invention further concerns polypeptides comprising all or a portion of the  
20 amino acid sequences of OATPs of the present invention. The inventors prefer polypeptides comprising all or a portion of the amino acid sequences shown as in SEQ ID NO:2 (OATP2), SEQ ID NO:4 (OATP-RP2), SEQ ID NO:6 (OATP-RP3), SEQ ID NO:8 (OATP-RP4), SEQ ID NO:10 (OATP-RP5) or SEQ ID NO:12 (OATP-RP1). Where a portion of an OATP of the present invention is used, preferably the  
25 portion exhibits the same biological activity of the OATP from which the portion is derived. For example, and within the scope of the invention, are polypeptides that comprise all or a portion of OATP2, OATP-RP2, OATP-RP3, OATP-RP4, OATP-RP5 or OATP-RP1 that exhibit transport activity. The portions may contain one or more mutations so that the protein(s) fail(s) to exhibit transport activity, but that can  
30 be used to screen for compounds that will modulate or bind to the protein or portion thereof.

Persons having ordinary skill in the art may prepare these polypeptides by methods known in the art. For example, one may use chemical synthesis, such as the solid phase procedure described by Houghton et al. (1985), Proc. Natl. Acad. Sci. 82: 5131-5. Another method is in vitro translation of mRNA. One may also produce the polypeptides in the above-described host cells, which is the preferred method. For example, one may synthesize DNA comprising all or a portion of SEQ ID NO:1, SEQ ID NO:3, SEQ ID NO:5, SEQ ID NO:7, SEQ ID NO:9, or SEQ ID NO:11 by PCR as described above, insert the synthesized DNA into an expression vector, transform a host cell with the expression vector, and culture the host cell to produce the desired polypeptides.

Persons skilled in the art can isolate and purify such polypeptides by any one of several known techniques: for example, ion exchange chromatography, gel filtration chromatography and affinity chromatography. Such techniques may require modification of the protein. For example, one may add a histidine tag to the protein to enable purification on a nickel column.

Persons skilled in the art can use the polypeptides of the invention in a wide variety of ways. For example, one may use them to generate polyclonal or monoclonal antibodies. One may then use such antibodies for immunodetection (e.g., radioimmunoassay, enzyme immunoassay, or immunocytochemistry), immunopurification (e.g., affinity chromatography) of polypeptides from various sources, or immunotherapy.

Persons skilled in the art may make modified OATP polypeptides by known techniques. Such modifications may cause higher or lower activity, permit higher levels of protein production, or simplify purification of the protein. Such modifications may help identify specific OATP amino acids involved in binding, which in turn may help rational drug design of OATP modulators. One can make amino acid substitutions based on similarity in polarity, charge, solubility, hydrophobicity, hydrophilicity and/or the amphipathic nature of the residues involved. For example, negatively charged amino acids include aspartic acid and glutamic acid; positively charged amino acids include lysine and arginine; amino acids with uncharged polar head groups or nonpolar head groups having similar hydrophilicity values include the following: leucine, isoleucine, valine, glycine, alanine; asparagine,

glutamine; serine; threonine; phenylalanine; tyrosine. All such modified polypeptides are included within the scope of the invention.

Preferred analogs include proteins that differ from the novel OATPs of the present invention (or biologically active fragments thereof) by one or more conservative amino acid substitutions or by one or more non-conservative amino acid substitutions, deletions or insertions which do not abolish the biological activity of the analog. Conservative substitutions typically include the substitution of one amino acid for another with similar characteristics, e.g., substitutions within the following groups: valine, glycine; glycine, alanine; valine, isoleucine, leucine; aspartic acid, glutamic acid; asparagine, glutamine; serine, threonine; lysine, arginine; and phenylalanine, tyrosine. Other conservative amino acid substitutions can be taken from the table below.

Table 1  
Conservative amino acid replacements.

For Amino Acid	Code	Replace with any of:
Alanine	A	D-Ala, Gly, beta-Ala, L-Cys, D-Cys
Arginine	R	D-Arg, Lys, D-Lys, homo-Arg, D-homo-Arg, Met, Ile, D-Met, D-Ile, Orn, D-Orn
Asparagine	N	D-Asn, Asp, D-Asp, Glu, D-Glu, Gln, D-Gln
Aspartic Acid	D	D-Asp, D-Asn, Asn, Glu, D-Glu, Gln, D-Gln
Cysteine	C	D-Cys, S-Me-Cys, Met, D-Met, Thr, D-Thr
Glutamine	Q	D-Gln, Asn, D-Asn, Glu, D-Glu, Asp, D-Asp
Glutamic Acid	E	D-Glu, D-Asp, Asp, Asn, D-Asn, Gln, D-Gln
Glycine	G	Ala, D-Ala, Pro, D-Pro, beta-Ala, Acp
Isoleucine	I	D-Ile, Val, D-Val, Leu, D-Leu, Met, D-Met
Leucine	L	D-Leu, Val, D-Val, Met, D-Met
Lysine	K	D-Lys, Arg, D-Arg, homo-Arg, D-homo-Arg, Met, D-Met, Ile, D-Ile, Orn, D-Orn
Methionine	M	D-Met, S-Me-Cys, Ile, D-Ile, Leu, D-Leu, Val, D-Val
Phenylalanine	F	D-Phe, Tyr, D-Thr, L-Dopa, His, D-His, Trp, D-Trp, Trans-3,4, or 5-phenylproline, cis-3,4, or 5-phenylproline
Proline	P	D-Pro, L-1-thioazolidine-4-carboxylic acid, D- or L-1-oxazolidine-4-carboxylic acid
Serine	S	D-Ser, Thr, D-Thr, allo-Thr, Met, D-Met, Met(O), D-Met(O), L-Cys, D-Cys
Threonine	T	D-Thr, Ser, D-Ser, allo-Thr, Met, D-Met, Met(O), D-Met(O), Val, D-Val
Tyrosine	Y	D-Tyr, Phe, D-Phe, L-Dopa, His, D-His
Valine	V	D-Val, Leu, D-Leu, Ile, D-Ile, Met, D-Met

Other analogs within the invention are those with modifications which increase protein or peptide stability; such analogs may contain, for example, one or more non-peptide bonds (which replace the peptide bonds) in the protein or peptide sequence. Also included are analogs that include residues other than naturally occurring L-amino acids. e.g., D-amino acids or non-naturally occurring or synthetic amino acids, e.g.,  $\beta$  or  $\gamma$  amino acids.

The inventors contemplate a number of other variations of the above-described polypeptides. Such variations include salts and esters of the polypeptides, as well as precursors of the aforementioned polypeptides (e.g., having N-terminal substituents such as methionine, N-formylmethionine and leader sequences). The invention includes all such variations.

#### Method for detecting nucleic acids

The present invention further concerns a method for detecting nucleic acids encoding OATP proteins. In this method, a person of ordinary skill in the art (a) contacts nucleic acids of unknown sequence with a nucleic acid having a sequence complementary to a known coding sequence (e.g., a sequence of at least about 10 nucleotides from, e.g., SEQ ID NO:1, SEQ ID NO:3, SEQ ID NO:5, SEQ ID NO:7, SEQ ID NO:9, or SEQ ID NO:11, particularly the coding regions thereof), wherein the latter nucleic acid has a detectable marker; and (b) determines the presence of marker bound to any of the nucleic acids of unknown sequence. The presence of bound marker indicates the presence of the desired nucleic acids. One can apply this method to detect OATP nucleic acids from other tissues (which may have different regulatory elements) and nucleic acids from other species (e.g., monkey).

Persons of ordinary skill in the art generally know how to obtain nucleic acids to be analyzed in this method. For genomic DNA, one can rapidly freeze tissue, crush the tissue into readily digestible pieces, and incubate the crushed tissue in proteinase K and SDS to degrade most cellular proteins. One can then deproteinize the genomic DNA by successive phenol/chloroform/isoamyl alcohol extractions, recover DNA by ethanol precipitation, dry it and resuspend it in buffer. For RNA, one can lyse cultured cells in 4M guanidinium solution, draw the lysate through a 20-gauge needle, pellet the RNA through a cesium chloride step gradient, and remove the supernatant. The pellet should contain purified RNA.

The detectable marker may be a radioactive ion linked to one of the nucleotides of the complementary nucleic acid. Common radioactive labels are  $^{32}\text{P}$  and  $^{35}\text{S}$ , although one may also use other labels such as biotin. Persons skilled in the art are aware of various methods to attach the labels to the complementary nucleic acid (e.g., the random primer method for attachment of  $^{32}\text{P}$  or  $^{35}\text{S}$ ).

Persons of ordinary skill in the art generally know how to carry out such a method of detecting nucleic acids. For example, one may perform a Southern or northern blot using a radiolabeled OATP complementary oligonucleotide probe. One can then detect hybridization by autoradiography. Depending on the marker, one may also use other detection methods (e.g., spectrophotometry).

Methods for detecting OATP modulators and compounds transported by the OATPs of the present invention

This invention further concerns methods for detecting modulators of the OATPs of the present invention, as well as methods for detecting compounds that are transported by the OATPs of the present invention (e.g., compounds that are transported into the liver that may be used as carriers for other compounds). A screen for OATP modulators entails detecting binding of molecules (e.g., polypeptides, natural products, synthetic compounds) in cells expressing OATP protein. Alternatively, a screen for OATP positive modulators and/or negative modulators entails detecting the augmentation and/or inhibition of transport of a known compound. A screen for OATP-transported compounds entails detecting the transport of molecules (e.g., polypeptides, natural products, synthetic compounds) by an OATP.

Cloning and sequencing of the OATPs of the present invention enables construction of cells useful in screening for natural products and synthetic compounds that bind to, modulate, and/or are transported by OATP activity. A process for detecting OATP modulators requires transforming a suitable vector into compatible host cells as described previously herein. One treats such transformed cells with test substances (e.g., synthetic compounds or natural products), and then measures activity in the presence and absence of the test substance.

OATP Assay

An assay for the measurement of OATP activity is performed as follows: HEK293 cells are plated in Dulbeccos Modified Eagles Medium (DMEM) plus 10%

fetal bovine serum plus penicillin and streptomycin, in poly-d-lysine coated dishes and co-transfected with OATP transporter expression plasmids using Lipofectamine Plus (Life Technologies, Inc.). The cells and media are assayed for substrate transport 24 hours later. Alternatively, cell lines engineered to stably express OATPs could be  
5 plated and assayed directly without transfection. To measure transport, media is removed and monolayers are assayed in triplicate by washing once in serum-free DMEM and adding the same medium containing [ $^3\text{H}$ ]-substrate alone or in the presence of various concentrations of unlabeled test compounds. For OATP2, the [ $^3\text{H}$ ]-substrate could be [ $^3\text{H}$ ]-pravastatin, [ $^3\text{H}$ ]-taurocholate, or [ $^3\text{H}$ ]-  
10 dehydroepiandrosterone sulfate, or [ $^{125}\text{I}$ ]-thyroid hormone (T4). Monolayers are incubated at room temperature for 5 to 10 minutes depending on the transporter. Then the cells are rapidly washed once with ice cold DMEM containing 5% BSA, twice with DMEM plus 0.1% BSA and once with DMEM alone. Cells are lysed in 0.1 N NaOH and a fraction of the lysate is used to determine radiolabel incorporation  
15 by liquid scintillation counting, and another is used to determine protein concentration in the lysate using the Bradford assay with BSA as a standard. The transport activity is expressed as moles of substrate transported into cells/mg of cell protein/minute.

#### Drug Targeting

Also included within the present invention is tissue expression of an OATP of  
20 the present invention. The OATPs of the present invention are also useful for targeting drugs to certain organs that express an OATP described herein (e.g., the liver), and for modulating the concentration of endogenous substrates.

For example, the novel organic anion transporter disclosed herein, OATP2, represents a potential therapeutic target due to its ability to modulate the cellular  
25 uptake and potential secretion of a several biologically important organic anions, including bile acids and the androgen hormone dehydroepiandrosterone sulfate ("DHEAS"). Furthermore, since OATP2 transports at least one drug (i.e. pravastatin), and other members of this family are known to transport a variety of other xenobiotics, this transporter could be exploited to optimize the delivery of drugs into  
30 liver and away from other tissues.

OATP2 is unique among the OATP family, in that it is the only known organic anion transporter that is expressed exclusively in the liver. Thus, drugs

optimized for this transporter could be targeted for hepatic delivery with greater selectivity than with any other known transporter. To generalize this approach, it may be possible to identify a small molecule "adaptor" that is efficiently recognized and transported by OATP2 (an OATP2-transported compound) that could be appended to  
5 other drugs for hepatic targeting even if the parent compound is not transported by OATP2.

Alternatively, if a therapeutic compound is taken up into the liver entirely or substantially by OATP2, one could inhibit hepatic clearance and thereby elevate circulating concentrations, or increase the compounds half-life in the periphery, by  
10 adding a functionality to said compound that disallows transport by OATP2. Likewise, if an endogenous substance utilizes OATP2 for liver uptake and clearance from the circulation, a competitive or non-competitive OATP2 inhibitor could elevate plasma levels of said substance. As an example, DHEAS is an adrenal androgen that declines with age and on the basis of some animal data, it has been suggested that  
15 replacement of DHEAS deficiency may stimulate age-related immune deficiencies, increase cognitive function and insulin sensitivity, and maintain bone mass. Inhibiting the hepatic clearance of endogenous DHEAS through blocking its interactions with OATP2 could result in elevated hormone levels in the absence of hormone supplementation.

20 With the information provided herein, one skilled in the art is able to identify molecules, both naturally occurring and synthetic (including therapeutic drugs), that are transported by the OATPs, e.g., OATP2, disclosed herein. OATPs as a class generally exhibit broad substrate specificity ("polyspecific" transporters). Thus, it is anticipated that many additional substrates of these transporters will be identified.

#### 25 Gene Therapy

Persons skilled in the art can also use sense and antisense nucleic acid molecules as therapeutic agents for OATP-related indications. One may construct vectors that direct the synthesis of the desired DNA or RNA or formulate the nucleic acid as described in the art.

30 Several references describe the usefulness of antisense molecule. See Toulme and Helene (1988), Gene 72: 51-8; Inouye (1988), Gene, 72: 25-34; Uhlmann and Peyman (1990), Chemical Reviews 90: 543-584; Biotechnology Newswatch (January

15. 1996), p. 4; Robertson. Nature Biotechnology 15: 209 (1997); Gibbons and Dzau (1996), Science 272: 689-93. One can design them based on genomic DNA and/or cDNA. 5' and 3' flanking control regions. other flanking sequences. intron sequences, and nonclassic Watson and Crick base pairing sequences used in formation of triplex DNA. Such antisense molecules include antisense oligodeoxyribonucleotides, oligoribonucleotides, oligonucleotide analogues, and the like, and may comprise at least about 15 to 25 bases.

Antisense molecules may bind noncovalently or covalently to the OATP DNA or RNA. Such binding could, for example, cleave or facilitate cleavage of OATP DNA or RNA, increase degradation of nuclear or cytoplasmic mRNA, or inhibit transcription, translation, binding of transactivating factors, or pre-mRNA splicing or processing. Antisense molecules may also contain additional functionalities that increase stability, transport into and out of cells, binding affinity, cleavage of the target molecule, and the like. All of these effects would decrease expression of OATP protein and thus make the antisense molecules useful as OATP modulators.

### EXAMPLES

The following examples are included for understanding the present invention and are not intended to limit the scope of Applicants invention, which is defined solely by the claims.

#### Example 1

Isolation of OATP2, OATP-RP1, OATP-RP2, OATP-RP3, OATP-RP4 and OATP-RP5 full length cDNAs and cloning into mammalian expression vectors

Human OATP2 was identified by searching the public EST databases for sequences homologous to human OATP. One EST sequence, Genbank accession number T73863, encoded a partial cDNA with significant sequence identity with OATP. EST sequences encoding partial cDNAs for OATP-RP1, OATP-RP2, OATP-RP3, OATP-RP4, and OATP-RP5 were identified by searching the public EST databases and the Incyte, Inc. EST database for sequences homologous to human OATP. The EST clone IDs corresponding to OATP-RP1 are 820117, 2668489, 1610706, 2972518, and 588148. These clones represent a contig encoding only part of the full length cDNA. The Incyte EST clone IDs corresponding to OATP-RP2 are

1664737 and 2641944. These clones represent a contig encoding only part of the full length cDNA. The Incyte EST clone IDs corresponding to OATP-RP3 are 2493241, 2497845, and 2664024. These clones represent a contig encoding only part of the full length cDNA. The Incyte EST clone IDs corresponding to OATP-RP4 are 1494683 and 1685219. These clones represent a contig encoding only part of the full length cDNA. The Incyte EST clone ID corresponding to OATP-RP5 is 925716. This clone encodes only part of the full length cDNA. Full length clones for each of the above genes were obtained using the Gene Trapper cDNA Positive Selection System (LifeTechnologies, Inc.). In this procedure, a single or multiple oligonucleotides complementary to each of the EST contigs or individual EST sequences, were biotinylated at the 3'-end and used to hybridize to a single-stranded human cDNA library constructed in pCMVSPORT2 (LifeTechnologies, Inc.). The sequence of oligonucleotides used for each gene as well as the tissue source of the libraries screened are shown in Table 2.

Table 2

Oligonucleotides used to screen for OATP Full length cDNAs using Gene-Trapper Selection

Gene	Biotinylated capture oligonucleotide(s) used	Seq ID number of oligonucleotide	Human cDNA library screened
OATP2	5'-ACCCTGTCTAGCAGGTTGCA-3'	13	liver
OATP-RP1	5'-CTGTCGGAGTCTTCAGATG-3'	14	brain
OATP-RP2	5'-TCCATCACAGCCTCCTACGC-3'	15	liver
OATP-RP3	5'-TGCCTCTACTCTGACCCTAG-3'	16	heart
OATP-RP4	5'-GGAGCAGTCATTGACACCAC-3'	17	heart
	5'-TGCTGGGAGTACAACGTGACG-3'	18	
	5'-ACAAGGAGGATGGACTGCAG-3'	19	
OATP-RP5	5'-CAGGAATCCCAGCTCCAGTG-3'	20	brain
	5'-GCTACAACCCAACTACTGGC-3'	21	
	5'-GGGACTAACTGTGATACTGG-3'	22	

Hybrids between the biotinylated oligonucleotides and single-stranded cDNA were captured on streptavidin-coated paramagnetic beads. After washing, the captured single-stranded cDNA targets was released from the biotinylated oligonucleotides and converted to dsDNA by DNA polymerase using the corresponding unbiotinylated oligonucleotide. Following transformation and plating, several positive clones for each gene were identified by PCR analysis. Full-length cDNA clones were identified

by sequencing. In the case of OATP-RP1, a partial cDNA was obtained by the above technique (pSP-RP1A). Another cDNA clone that was part of the OATP-RP1 contig was identified by searching the public EST databases (Genbank accession number AI027850). An EcoRI-NotI fragment of this clone containing the first 477 nucleotides of OATP-RP1 (SEQ ID NO: 11) (obtained from Research Genetics, Inc.) was ligated to EcoRI-Not I digested pSP-RP1A to generate the full length sequence.

Two polymorphic positions were identified when sequencing multiple OATP-RP4 cDNA clones. Thus, nucleotide number 713 of SEQ ID NO: 7 can be either a C, encoding Leu in SEQ ID NO:8, or a T, encoding a Phe in SEQ ID NO:8. Similarly, nucleotide number 2397 of SEQ ID NO: 7 can be either a G, encoding a Gly in SEQ ID NO:8, or a T, encoding a Val in SEQ ID NO:8.

For expression studies, OATP2 cDNA was cloned into the expression vector pCEP4 $\beta$ R, a modified form of pCEP4 (Invitrogen, Inc.) in which the CMV promoter-driven expression cassette has been inverted, and used in transient transfections. To accomplish this, OATP2 cDNA in pCMVSPORT2, corresponding to nucleotides 59 through 2361 of SEQ ID NO:1, was excised by digestion with KpnI and NotI. This fragment was cloned into KpnI-NotI digested pCEP4 $\beta$ R. This clone, pCEP-OATP2 was used for transient transfection expression studies.

20

#### Example 2

Tissue and cellular distribution of OATP2, OATP-RP1, OATP-RP2, OATP-RP4, and OATP-RP5

The tissue distribution of OATP2, OATP-RP1, OATP-RP2, OATP-RP4, and OATP-RP5 expression was determined by Northern blotting of poly A+ RNA from a variety of human tissues (Figure 1). Transporters of this family previously described in the literature, namely human OATP, rat oatp1, rat oatp2 and rat oatp3, are all expressed in liver, kidney and brain. All of the above transport bile acids as well as a variety of other substrates that are specific for subsets of these transporters. In contrast, the expression of OATP2, which also transports bile acids, is very hepatocyte-specific; a major 3.2 kb and several minor hybridizing bands were observed only in RNA from liver and no other tissue. The specific cell types that express this transporter were examined by *in situ* hybridization of OATP2 riboprobe to human liver samples. Strong hybridization signal was seen localized to hepatocytes

throughout the liver lobule with no significant difference in signal intensity among centrilobular, midzonal or periportal regions. No signal was observed in bile ducts, Kupffer cells, or blood vessels, nor in any cell types from human lung (data not shown).

5 OATP-RP1 is expressed in nearly all tissues tested with highest abundance in skeletal muscle, lung, placenta, and heart. OATP-RP2 is ubiquitously expressed in all tissues tested. OATP-RP4 has a much more restricted pattern of expression with abundant transcripts in skeletal muscle and heart and much less in prostate and thymus. The expression of OATP-RP5 is likewise tissue specific, with brain and testes being  
10 the only sites where transcripts were detected.

### Example 3

#### Expression of OATP2 in transfected cells

293EBNA cells (Invitrogen, Inc.), an HEK293 cell derivative, were transiently  
15 transfected with the OATP2 expression vector pCEP-OATP2, or the pCEP4 vector alone (MOCK) and the transport of [ $^3$ H]-labeled substrates was determined 24 hours later. Figure 2A shows specific uptake of [ $^3$ H]-pravastatin and [ $^3$ H]-DHEAS. Figures 2B and 2C show the specific uptake of [ $^3$ H]-taurocholate and [ $^{125}$ I]-thyroid hormone (T<sub>4</sub>), respectively. The uptake of radiolabeled substrate for 5 minutes into cells  
20 transfected with pCEP-OATP2 or empty vector (MOCK) was determined in the absence (solid bars) and presence (open bars) of excess unlabeled substrate. Thus, OATP2 is a liver specific human transporter of at least some HMG CoA reductase inhibitors, bile acids, adrenal steroids, and thyroid hormone.

We claim:

1. A purified and isolated nucleic acid sequence encoding all or a portion of an organic anion transport protein ("OATP"), said OATP comprising an amino acid sequence selected from the group consisting of SEQ ID NO:2 (OATP2), SEQ ID NO:4 (OATP-RP2), SEQ ID NO:6 (OATP-RP3), SEQ ID NO:8 (OATP-RP4), SEQ ID NO:10 (OATP-RP5), and SEQ ID NO:12 (OATP-RP1).
2. The nucleic acid sequence of claim 1 comprising (a) a nucleic acid sequence selected from the group consisting of SEQ ID NO:1, SEQ ID NO:3, SEQ ID NO:5, SEQ ID NO:7, SEQ ID NO:9, and SEQ ID NO:11; (b) the coding region of (a); (c) the complement of (a) or (b); or (d) nucleic acid sequences that differ from (a), (b) or (c) due to degeneracy of the genetic code.
3. An expression vector comprising a nucleic acid molecule as claimed in claim 1 or 2 and an expression control sequence operatively linked to the nucleic acid molecule.
4. A transformant host cell including an expression vector comprising a nucleic acid molecule as claimed in claim 1 or 2 and an expression control sequence operatively linked to the nucleic acid molecule.
5. An OATP protein comprising the amino acid sequence selected from the group consisting of SEQ ID NO:2 (OATP2), SEQ ID NO:4 (OATP-RP2), SEQ ID NO:6 (OATP-RP3), SEQ ID NO:8 (OATP-RP4), SEQ ID NO:10 (OATP-RP5), and SEQ ID NO:12 (OATP-RP1).
6. A modified OATP protein comprising an OATP of claim 5 that maintains an activity of said OATP protein of claim 5, wherein said modified OATP protein comprises at least one amino acid substitution or deletion.
7. A method of producing OATP, said method comprising the steps of:

- a) inserting a nucleic acid sequence according to claim 1 or 2 encoding said OATP protein, or a homologue thereof, into an appropriate expression vector,
- b) transfecting said expression vector into an appropriate transfection host cell,
- c) growing said transfected host cells in an appropriate culture media, and
- d) purifying the OATP protein, or a homologue thereof, from said culture media.

10

8. An isolated nucleic acid sequence which hybridizes under stringent conditions to the nucleic acid sequence of claim 1 or 2, wherein said nucleic acid sequence contains at least 18 contiguous nucleotides from SEQ ID NO:1, SEQ ID NO:3, SEQ ID NO:5, SEQ ID NO:7, SEQ ID NO:9 or SEQ ID NO:11.

15

9. An antibody specific for the OATP as claimed in claim 5.

10. The antibody of claim 9 wherein said antibody is a monoclonal antibody.

20

11. The OATP of claim 5, produced by:

- a) inserting a nucleic acid sequence encoding said OATP into an appropriate expression vector,
- b) transfecting said expression vector into an appropriate transfection host cell,
- c) growing said transfected host cells in an appropriate culture media, and
- d) purifying the OATP from said culture media.

30

12. A method for identifying a ligand which is capable of binding to the OATP of claim 5, or to a part of said OATP, said method comprising the steps of:

(a) reacting said OATP, or part of said OATP, with said ligand which potentially is capable of binding to the OATP or part of said OATP, under conditions which permit the formation of ligand-OATP complexes; and

(b) assaying for ligand-OATP complexes, for free ligand, or for non-complexed OATP.

13. A method for identifying a substrate which is capable of being transported by the OATP of claim 5, or a part of said OATP, said method comprising the steps of:

10 (a) reacting said OATP, or part of said OATP, with said substrate which is potentially capable of being transported by the said OATP or part of said OATP, under conditions which permit the movement of said substrate across a membrane; and

(b) assaying for the movement of said substrate across the membrane.

15

14. A method of delivering a molecule to a an organ that expresses an OATP protein of claim 5, said method comprising:

(a) identifying a substrate that is transported by said OATP;

(b) joining said substrate to said molecule to be delivered to form a substrate-molecule fusion compound; and

20

(c) providing said substrate-molecule fusion compound to said organ.

15. A fusion protein comprising all or a portion of the OATP of claim 5, attached to a second polypeptide.

25

16. A method for identifying a modulator which is capable of augmenting or inhibiting the transport of a substrate by the OATP of claim 5, or a part of said OATP, said method comprising:

a) reacting said OATP, or part of said OATP, with said substrate and said modulator which potentially is capable of augmenting or inhibiting the transport of a substrate under conditions which permit the movement of said substrate across a membrane;

30

- b) measuring the augmentation or inhibition of transport of said compound by said modulator.

17. A nucleic acid molecule of claim 2, wherein said nucleic acid molecule  
5 comprises the OATP gene, or a complement of the OATP gene, contained in ATCC  
Accession Number 207209.

18. A nucleic acid molecule of claim 2, wherein said nucleic acid molecule  
comprises the OATP gene, or a complement of the OATP gene, contained in ATCC  
10 Accession Number 207210.

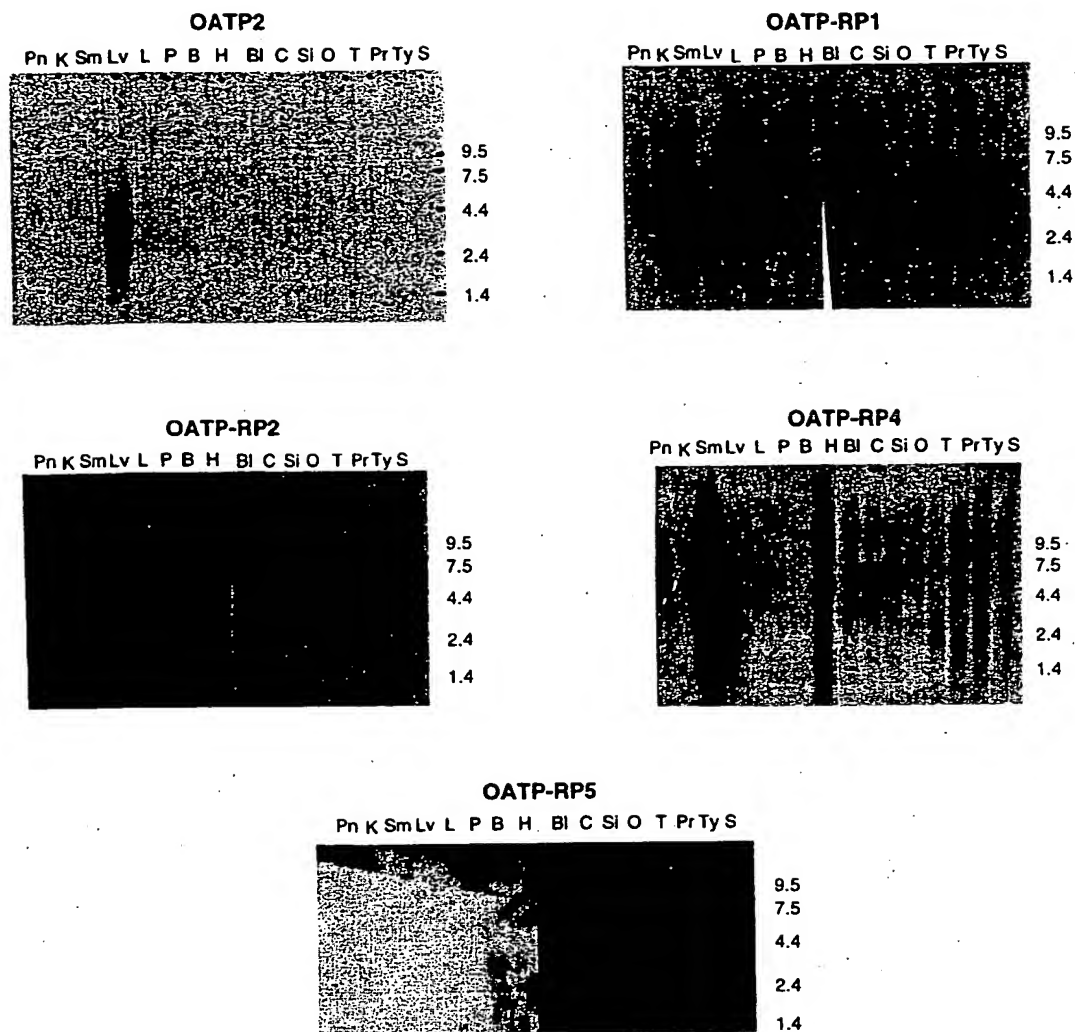

19. A nucleic acid molecule of claim 2, wherein said nucleic acid molecule  
comprises the OATP gene, or a complement of the OATP gene, contained in ATCC  
Accession Number 207211.

15 20. A nucleic acid molecule of claim 2, wherein said nucleic acid molecule  
comprises the OATP gene, or a complement of the OATP gene, contained in ATCC  
Accession Number 207212.

20 21. A nucleic acid molecule of claim 2, wherein said nucleic acid molecule  
comprises the OATP gene, or a complement of the OATP gene, contained in ATCC  
Accession Number 207213.

22. A nucleic acid molecule of claim 2, wherein said nucleic acid molecule  
25 comprises the OATP gene, or a complement of the OATP gene, contained in ATCC  
Accession Number 207214.

WO 00/71566 A3

(54) Title: NOVEL ORGANIC ANION TRANSPORT PROTEINS

(57) Abstract: The current invention discloses nucleic acid and amino acid sequences for novel organic anion transfer proteins ("OATPs"). The invention encompasses the OATPs described herein, together with vectors containing the cDNA sequences, host cells containing the vectors and polypeptides having all or part of an OATP. Also encompassed are uses for OATPs for targeting drugs to specific organs and for modulating the concentration of endogenous substrates.

# INTERNATIONAL SEARCH REPORT

International application No.  
PCT/US00/13939

## A. CLASSIFICATION OF SUBJECT MATTER

IPC(7) : Please See Extra Sheet.

US CL : Please See Extra Sheet.

According to International Patent Classification (IPC) or to both national classification and IPC

## B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

U.S. : Please See Extra Sheet.

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched  
NONE

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)  
Please See Extra Sheet.

## C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
A	JACQUEMIN et al. Expression cloning of a rat liver Na <sup>+</sup> -independent organic anion transporter. Proc. Natl. Acad. Sci. USA. January 1994, Vol. 91, pages 133-137.	1-22

☐ Further documents are listed in the continuation of Box C. ☐ See patent family annex.

* Special categories of cited documents:	*T* later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
*A* document defining the general state of the art which is not considered to be of particular relevance	*X* document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
*B* earlier document published on or after the international filing date	*Y* document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art
*L* document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)	*A* document member of the same patent family
*O* document referring to an oral disclosure, use, exhibition or other means	
*P* document published prior to the international filing date but later than the priority date claimed	

Date of the actual completion of the international search
